SECTION A

Basic ideas of vector calculus, Gradient, Divergence, curl and their physical significance, Coulomb's law in vector form, long uniformly charged wire, Charged disc. Stokes's theorem and its applications in electrostatic field, $\text{curl } E = 0$. Electric field as gradient of scalar potential. Calculation of E due to a point charge and dipole from potential. Potential due to arbitrary charge distribution and multipole moments. Poission and Laplace's equations and their solutions in Cartesian and concept of electrical images.

SECTION B

Calculation of electric potential and field due a point charge placed near an infinitely conducting sheet. Current and current density, equation of continuity. Microscopic form of Ohm's Law. ($J = \sigma E$) and conductivity. Failure of Ohm's Law. Invariance of charge. E in different frames of reference. Field of a point charge moving with constant velocity. Interaction between moving charges and force between parallel currents.
